Report: SCRUM Sprint 1

*Work item added after sprint start

1. Did your estimations reflect the actual effort?

Answer:

Yes, the story point estimates reasonably reflected the relative effort of the User Stories. Smaller stories such as receiving reservation confirmation were assigned fewer points, while more complex functionality such as reserving a charging slot was assigned more points. The Fibonacci scale helped represent differences in complexity and uncertainty.

2. Was your backlog well-prioritized?

Answer:

Yes, the backlog was prioritized according to user impact and system importance. Core functions such as viewing available charging slots, matching the vehicle connector, and reserving a charging slot were given higher priority because they are essential to the main charging reservation process.

3. How did your simulated sprint align with your plan?

Answer:

The simulated sprint followed the planned Scrum workflow. User Stories were selected for the sprint and progressed through the different stages of the board. The work items were moved through In Progress and finally to Done, and two sprints were completed as required.

4. What insights did the burndown chart give about your team's capacity?

Answer:

The burndown chart provided a visual representation of how quickly the team completed the planned work. It helped compare remaining work with expected progress and provided an indication of the team's capacity. Completing the sprint work showed that the selected workload was manageable for the simulated sprint.
